**High  
concentration**

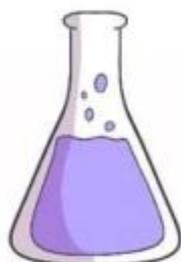

**Low  
concentration**

- **Biophysics** deals with application of **physical and chemical laws to biological systems**.
  - Many physiological processes follow **physico-chemical principles**.
  - Important processes include:
    - **Diffusion**
    - **Filtration**
    - **Osmosis**
    - **Electrolyte balance**.
  - These laws explain **movement of substances across biological membranes**.
-

## Units of Concentration of Solutions

# Chemical Concentration

## Molarity (M) – Mole per Lite

Moles of solute dissolved in 1 liter of solution.

$$M = \frac{\text{Moles of solute}}{\text{Volume of solution (L)}}$$

## Molality (m) – Mole per Kg

Moles of solute per kilogram of solvent.

$$m = \frac{\text{Moles of solute}}{\text{Mass of solvent (kg)}}$$

## Normality (N) – Equivalent per Liter

Gram equivalents of solute per liter of solution.

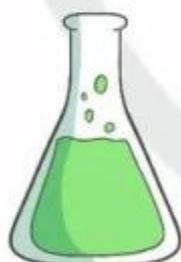

$$N = \frac{\text{Gram equivalents}}{\text{Volume of solution (L)}}$$

## Formality (F) – Ionic Mass per Liter

Gram formula masses of ionic solute per liter of solution.

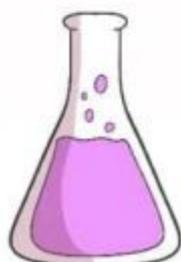

$$F = \frac{\text{Mass of solute (g)}}{\text{Formula mass} \times \text{Volume (L)}}$$

## Mole Fraction ( $\chi$ ) – Ratio of Moles

Ratio of moles of one component to total moles in mixture.

$$X_A = \frac{n_A}{n_A + n_B}$$

## Parts Per Million (ppm) – Ultra Low Concentration

Mass of solute per million parts of solution.

$$\text{ppm} = \frac{\text{Mass of solute}}{\text{Mass of solvent}} \times 10^6$$

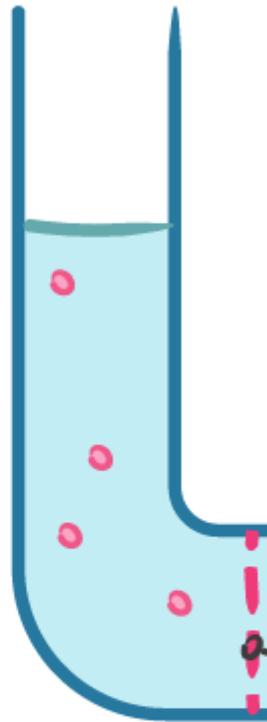

# OSMOSIS & OSMOLARITY

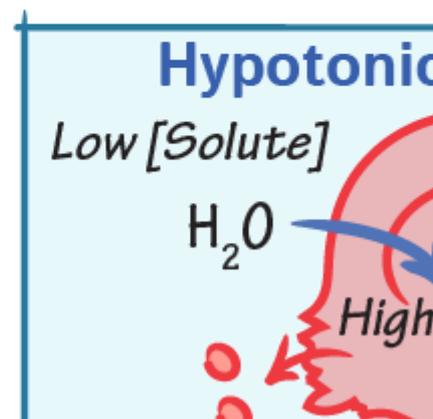

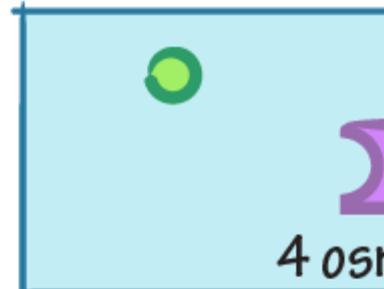

## + Key Concepts

- ✓ *Osmosis* —
  - ✓ Diffusion of water across a semi-permeable membrane
- ✓ *Osmolarity* (osmotic concentration) —
  - ✓ Solute concentration, osmoles of solute per liter of solvent

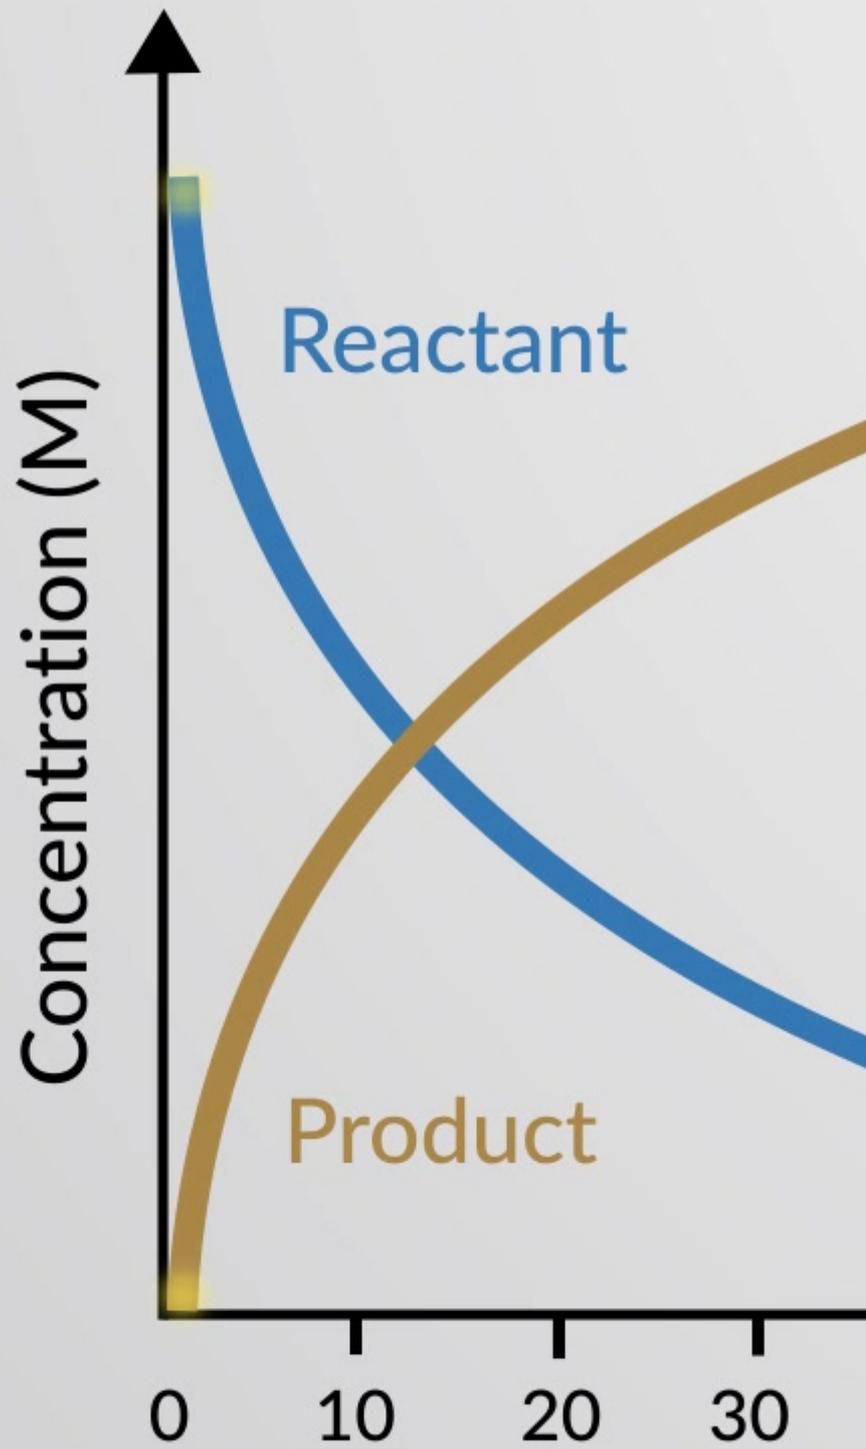

Low solute concentration

Ionic compound in solution

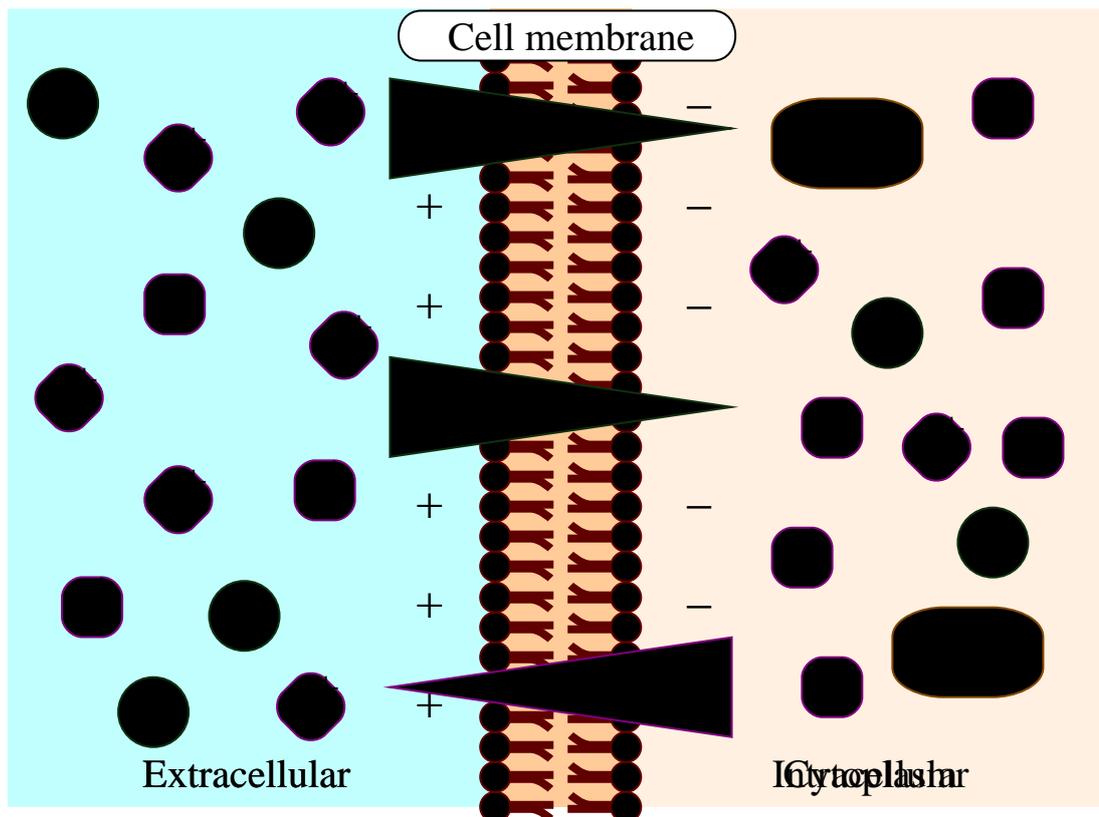

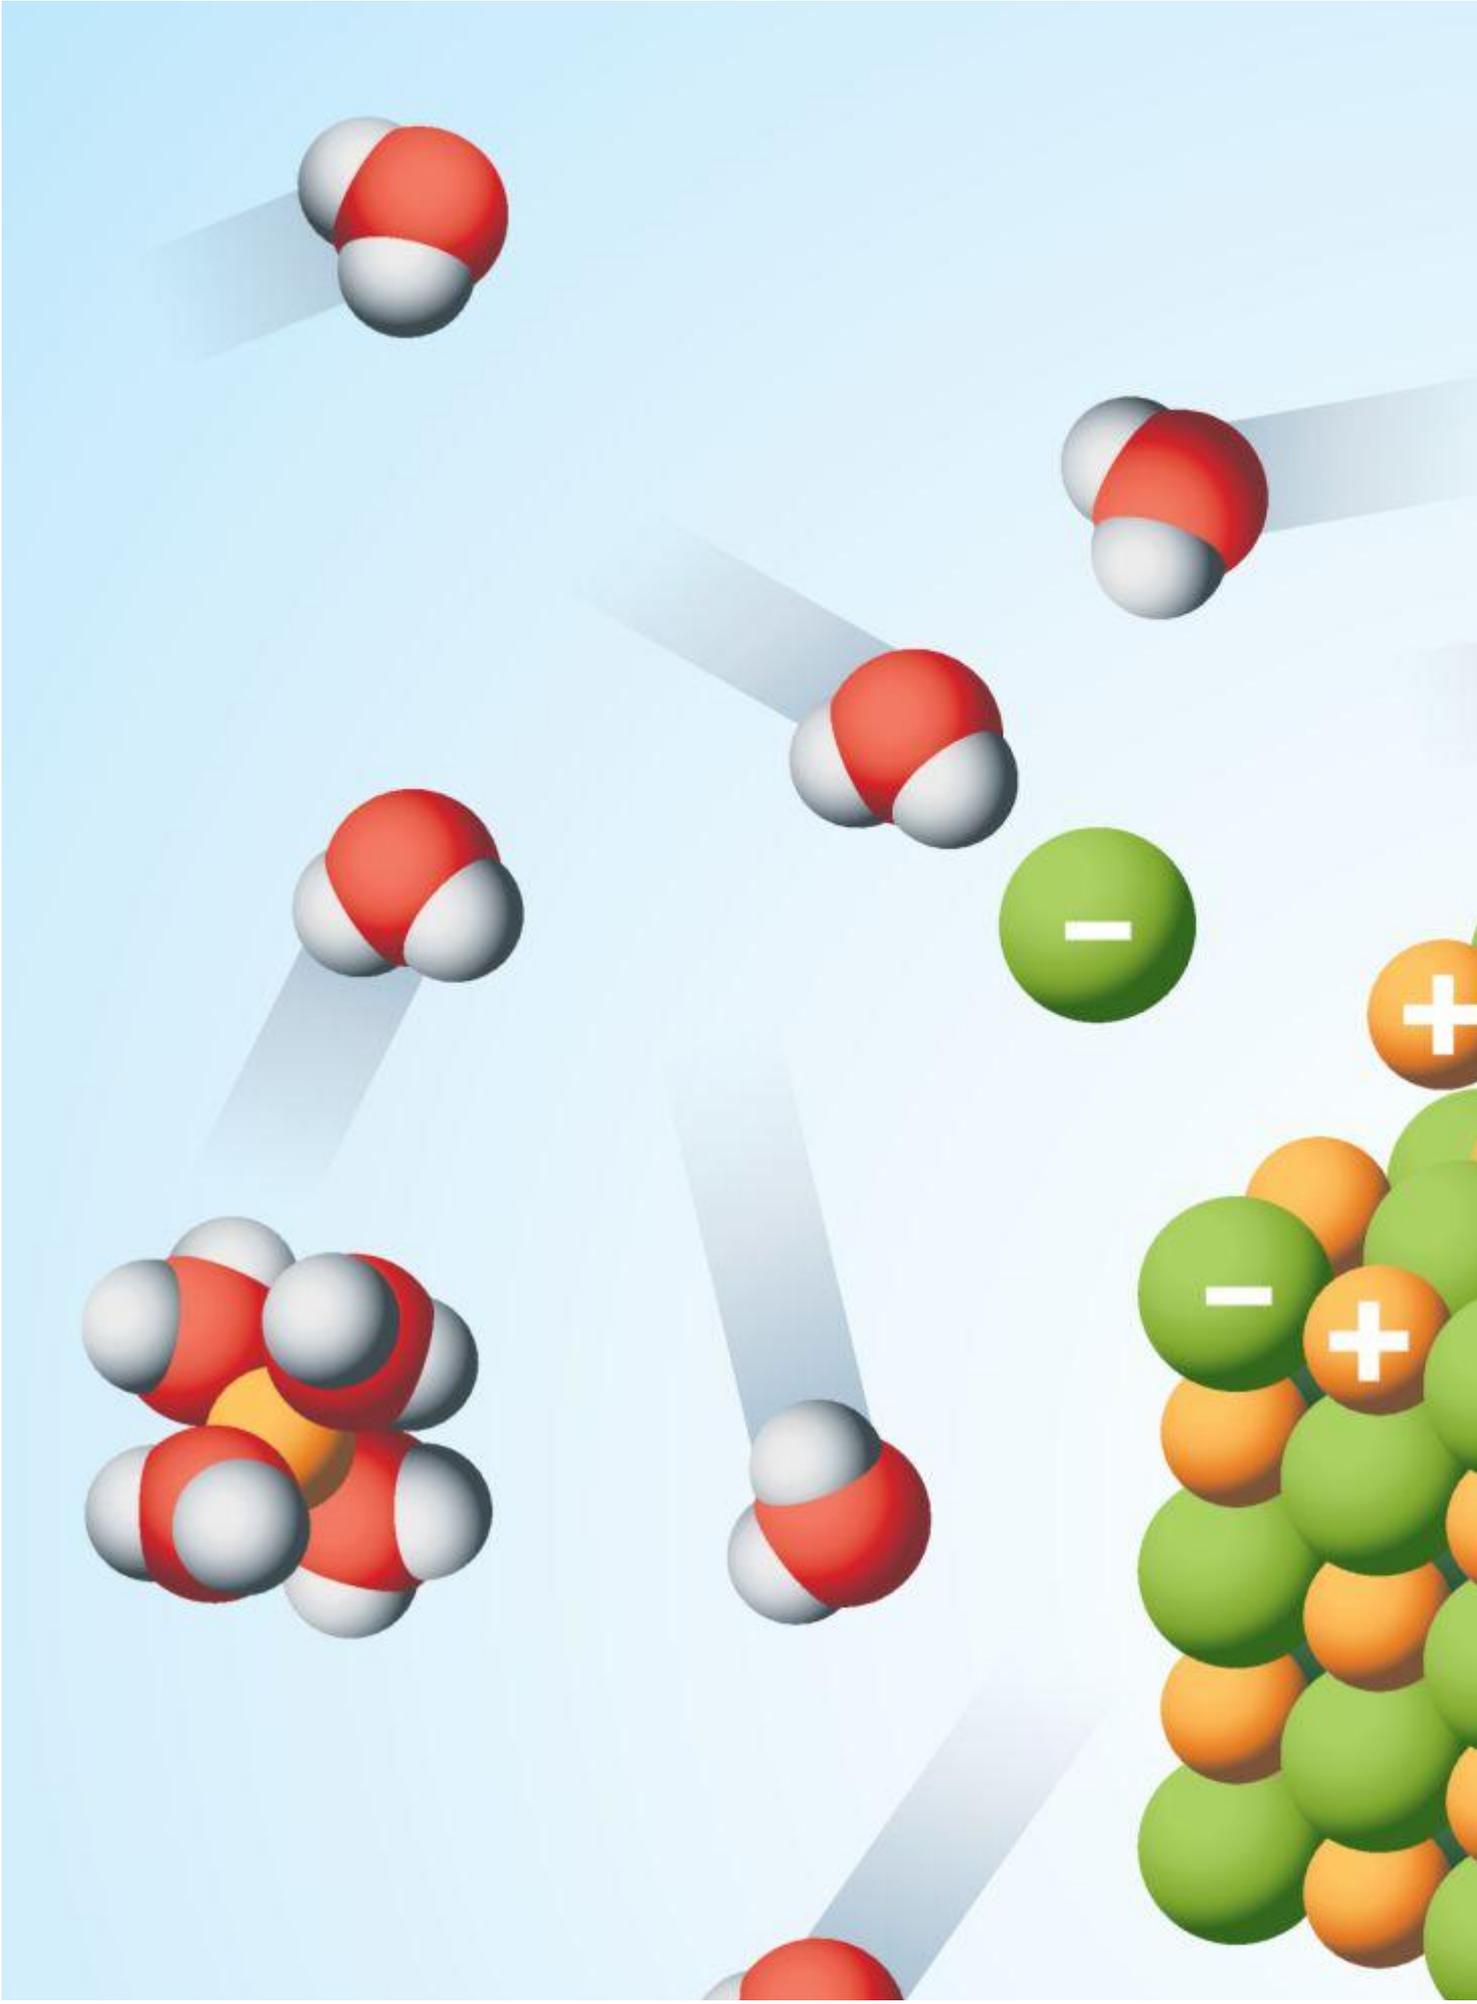

Image

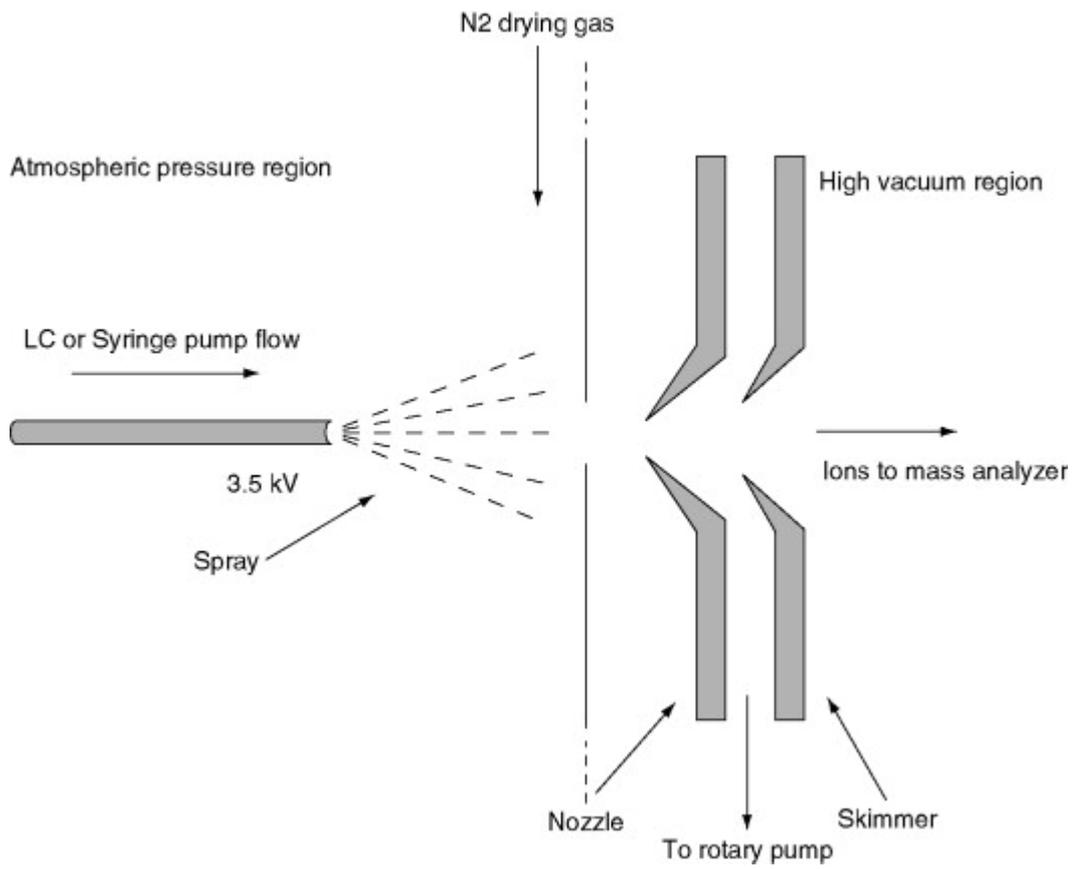

- Concentration expresses **amount of solute dissolved in a solvent**.
- Important units used in physiology include:
  - **Molarity** – number of moles of solute per litre of solution.
  - **Normality** – number of gram equivalents per litre of solution.
  - **Percentage concentration** – grams of solute in 100 mL of solution.
  - **Osmolarity** – concentration of osmotically active particles.
- These units are useful in **physiological and clinical calculations**.

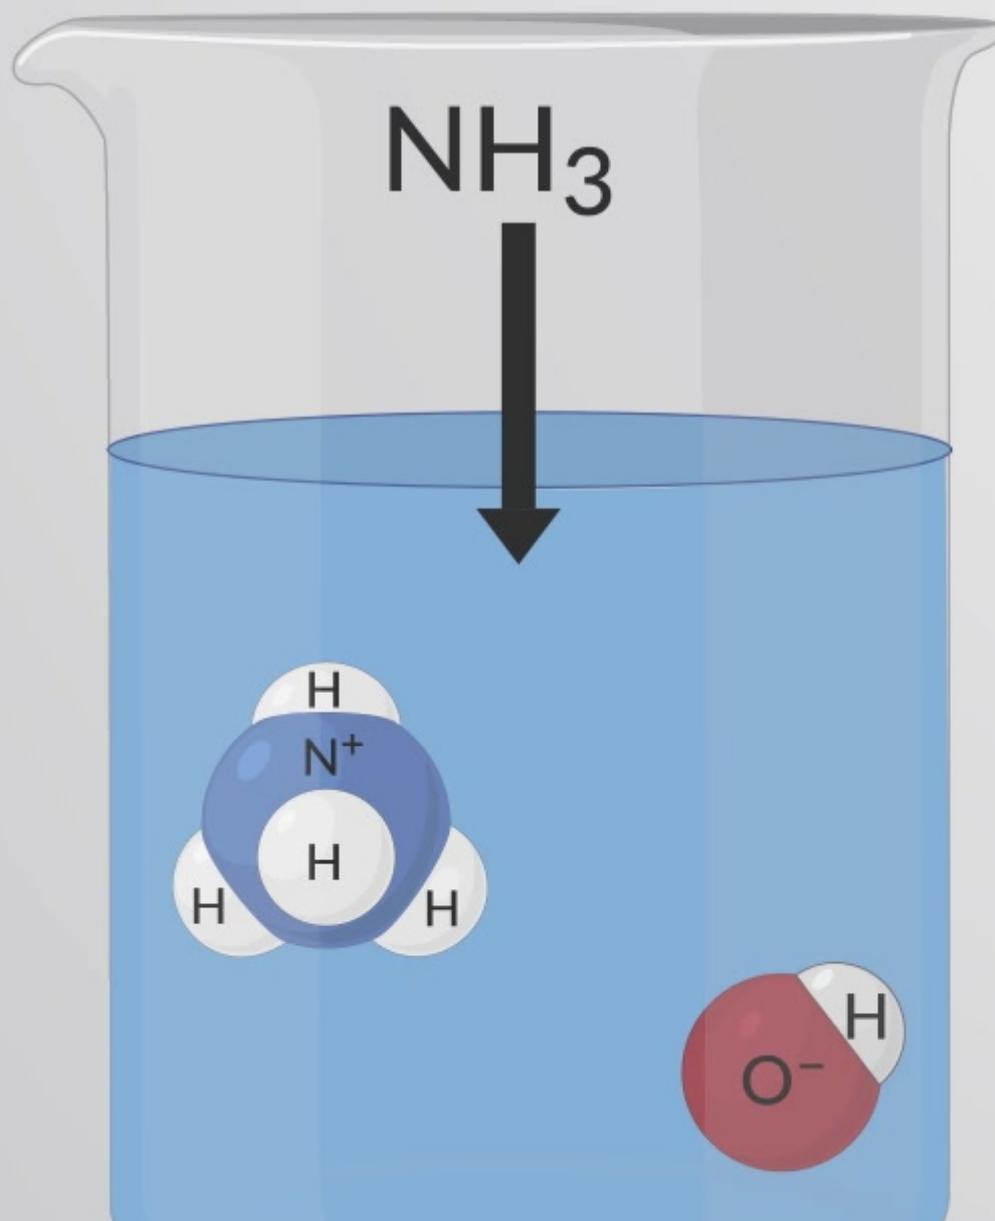

## Ions, Electrolytes and Non-electrolytes

Acid

- Substances in solution may exist as **ions or molecules**.
  - Based on their dissociation in water they are classified as:
  - **Ions**
  - **Electrolytes**
  - **Non-electrolytes**.
- 

## Ions

- **Ions are electrically charged particles** formed by dissociation of substances in solution.
  - **Positive ions (cations)** – sodium (Na<sup>+</sup>), potassium (K<sup>+</sup>), calcium (Ca<sup>2+</sup>).
  - **Negative ions (anions)** – chloride (Cl<sup>-</sup>), bicarbonate (HCO<sub>3</sub><sup>-</sup>).
  - Ions are essential for **nerve conduction, muscle contraction and fluid balance**.
- 

## Electrolytes

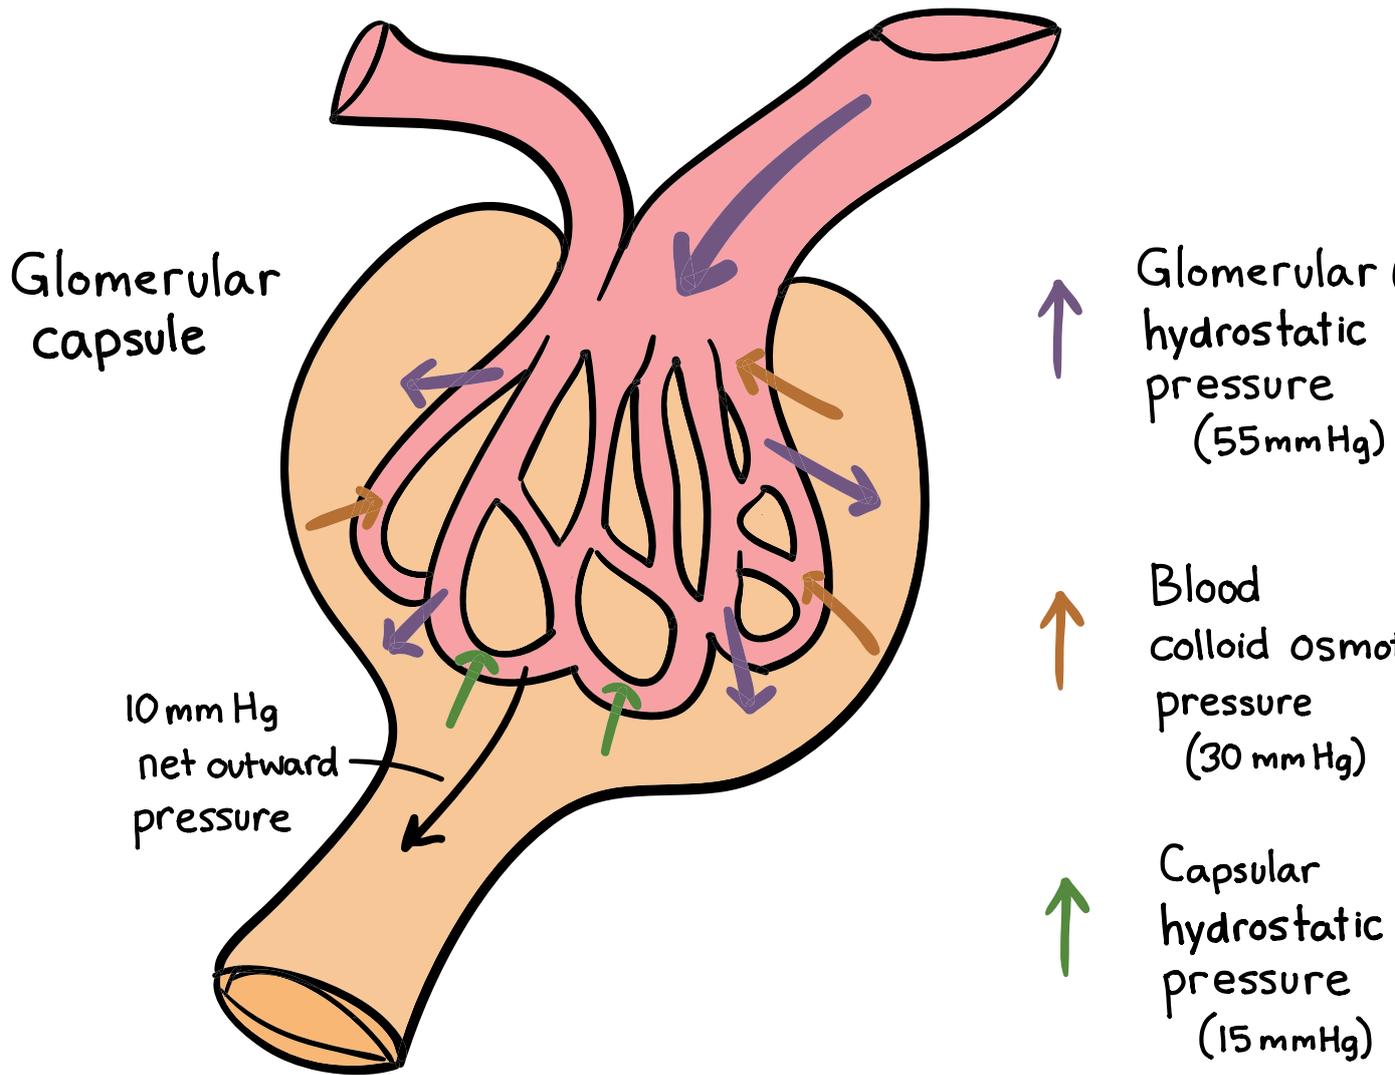

- **Electrolytes are substances that dissociate into ions in aqueous solution**
  - They conduct **electric current** when dissolved in water.
  - Examples include **sodium chloride, potassium chloride and calcium salts**.
  - Electrolytes are important for **osmotic balance and physiological functions**.
- 

## Non-electrolytes

- **Non-electrolytes do not dissociate into ions in solution**
  - They remain as **uncharged molecules**.
  - Examples include **glucose, urea and alcohol**.
  - They do not conduct **electric current in solution**.
- 

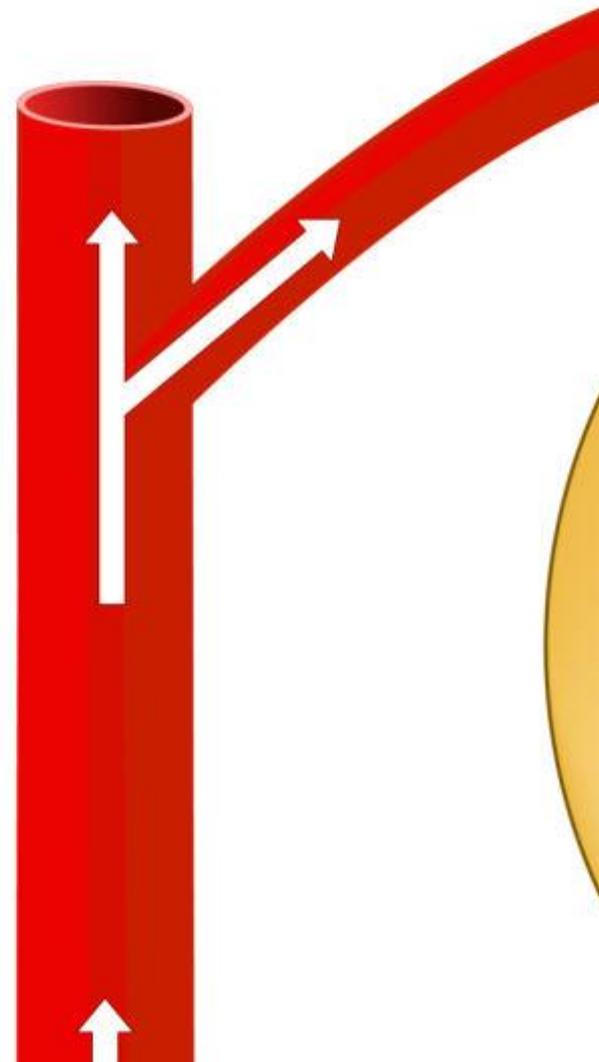

## Filtration

Image

U

Afferent arter

Image

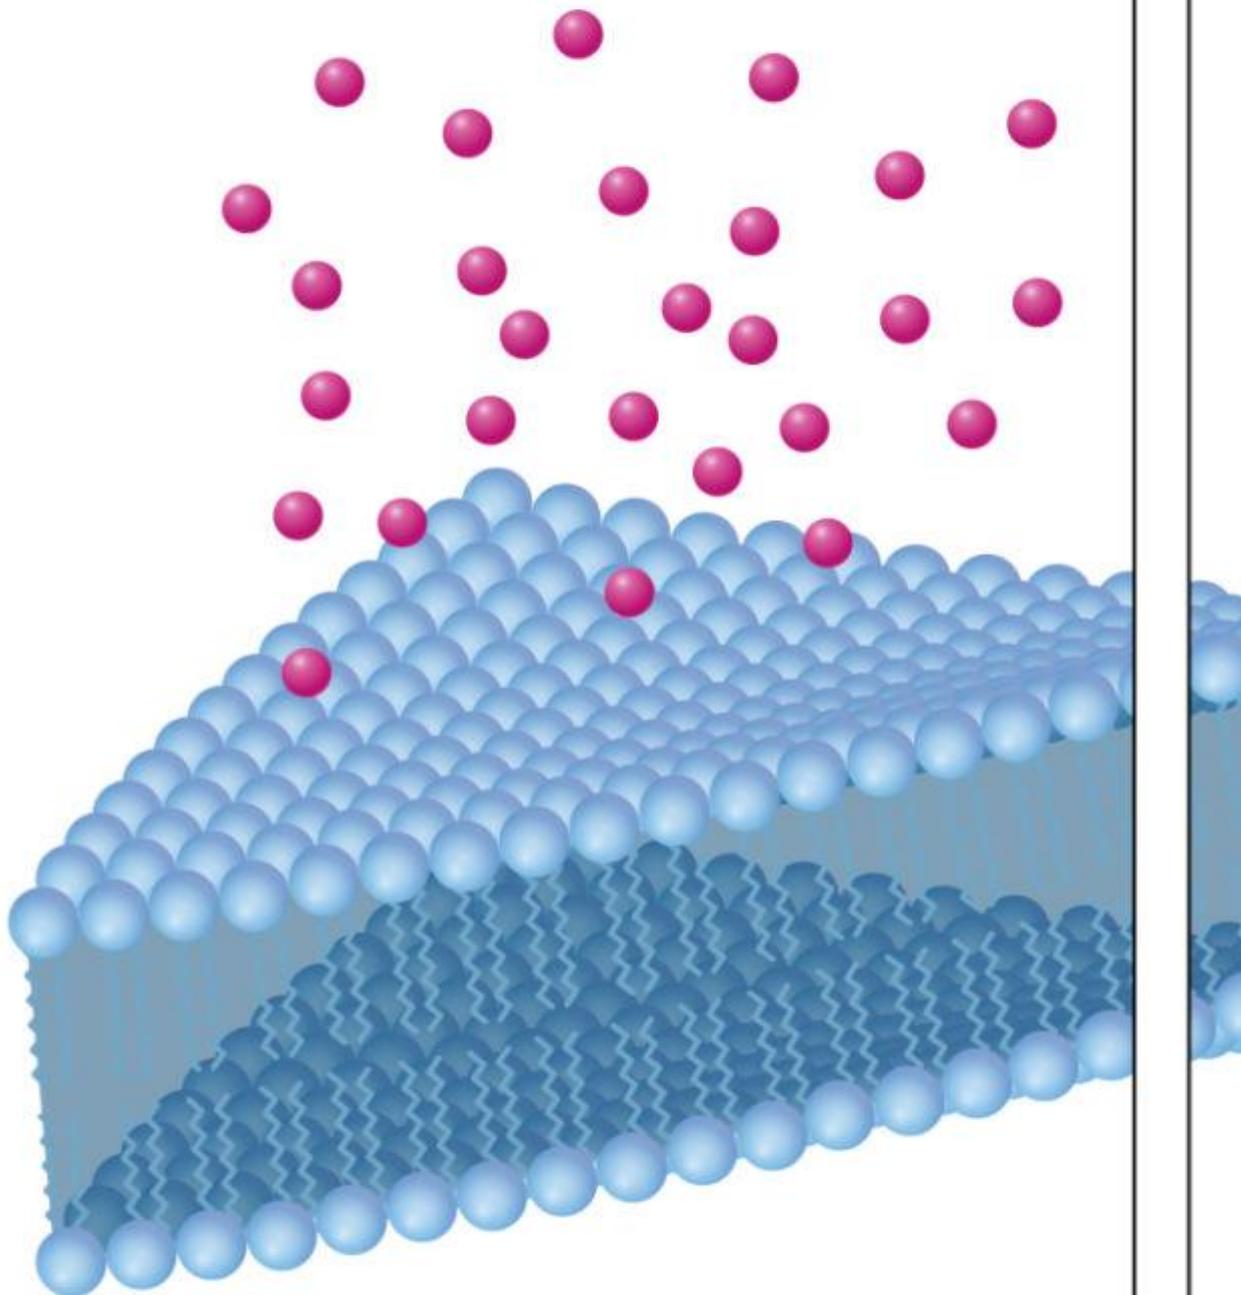

- **Filtration** is movement of fluid and dissolved substances through a membrane due to **pressure difference**.
  - Driven mainly by **hydrostatic pressure**.
  - Occurs across **capillary walls and kidney glomerulus**.
- 

## Physiological Importance of Filtration

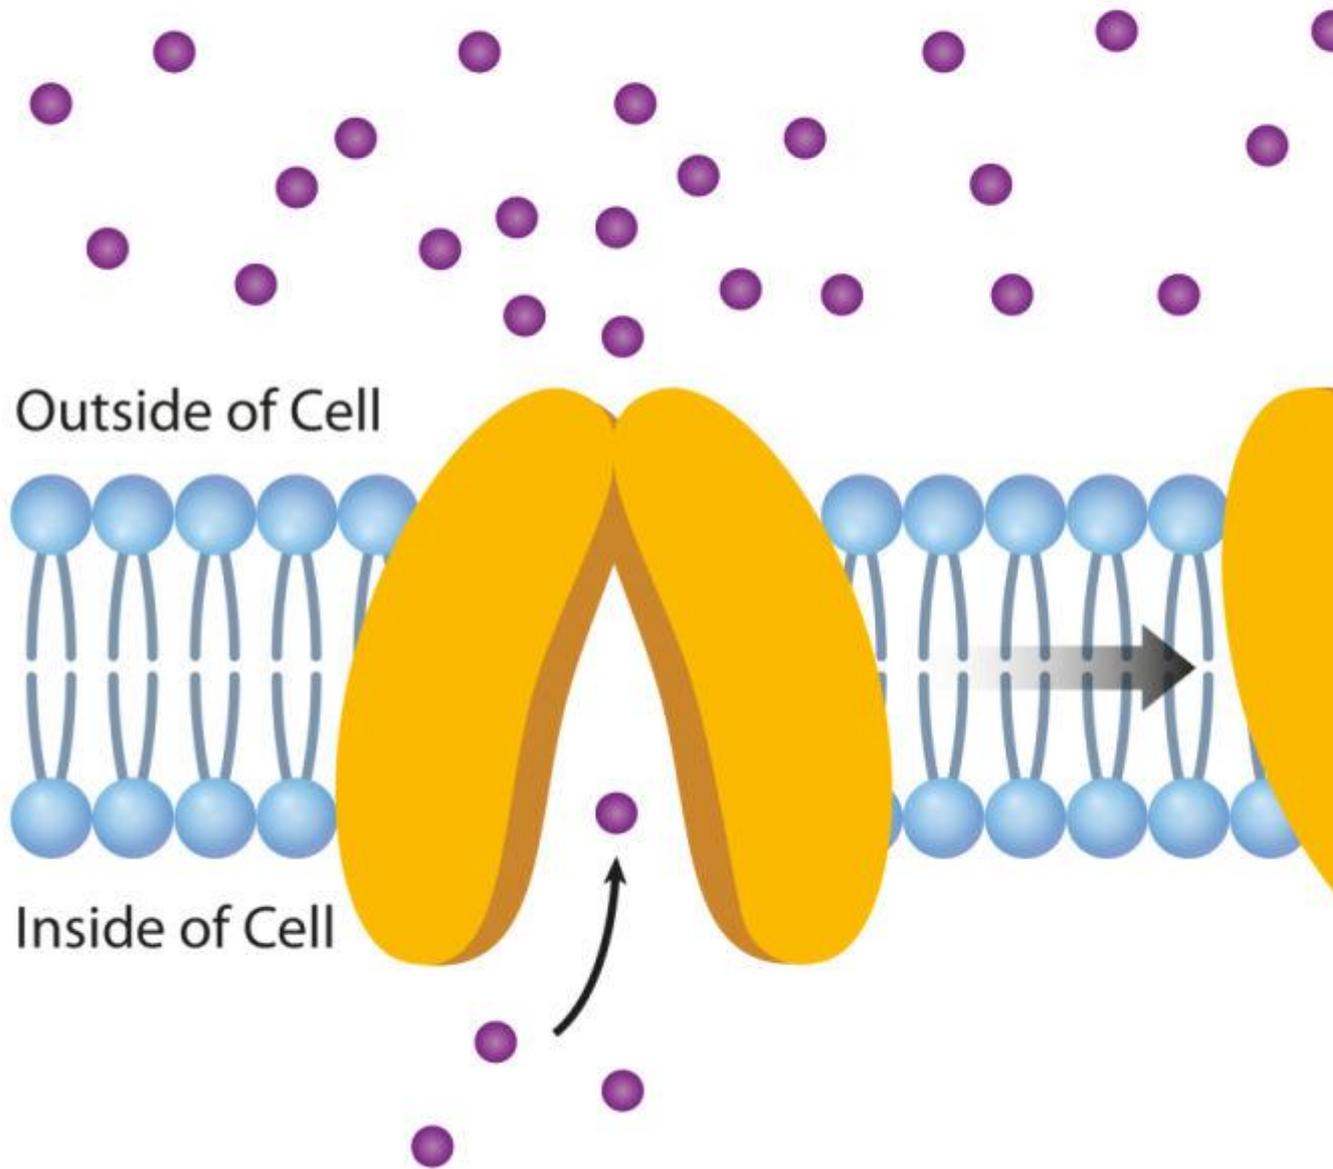

- Important in **formation of tissue fluid from capillaries**.
  - Essential in **glomerular filtration in kidneys**.
  - Helps remove **waste products from blood**.
-

**FROM  
PULMONARY ARTERY**

- **Diffusion** is movement of molecules from **higher concentration to lower concentration**.
  - Occurs due to **random molecular motion**.
  - Does not require **energy expenditure**.
  - Continues until **equilibrium is reached**.
  
  - Examples in physiology:
  - Exchange of **oxygen and carbon dioxide in lungs**.
  - Movement of **solutes across cell membranes**.
-

# Concentr

- **Concentration** refers to the **amount of solute present in a given volume of solution**.
- A **concentration gradient** exists when two regions have different solute concentrations.
- Diffusion occurs **along this gradient from higher to lower concentration**.
- Concentration gradient is a **major driving force for diffusion in physiological processes**.

Biology often looks complicated, but at its core it obeys the same simple rules as chemistry and physics: particles drift from **crowded places to emptier ones**, pressure pushes fluids through filters, and electric charges guide ions—life simply organizes these basic forces into astonishingly complex systems.
